Inducing angiogenesis in mammal at desired sites for promoting won healing, by administering soluble fragment of extracellular domaintumor necrosis factor related endothelium proliferative agent pro

Example 2; Col 73-74; 53pp; English.

The present invention relates to extracellular signal molecules, particularly members of tumour necrosis factor (TNF) family molec designated as TREPA (TNF related endothelium proliferative agent) Soluble biologically active TREPA are used to treat TREPA-associal diseases, tumours or metastases. TREPA is used for inducing anglo in human for promoting wound healing and for vascularising grafte for successful grafting and to promote tissue grafts. The present sequence is a cDNA clone ID #690050 encoding human TREPA

This invention describes isolated Tumor Necrosis Factor (TNF) fareceptor polypeptides: APO4, APO6, APO8 and APO9 or their active fragments, and isolated TNF related ligands 1 and 3 TURNIA and I their active fragments. APO4 is useful for diagnosing prostate catestermining levels of APO4 in an individual. Prostate cancer can treated using APO4 selective binding agents linked to a theraper moiety. APO4 polypeptides are also useful for identifying select binding agents, useful in diagnosis/treament of disease by binding agents to the polypeptide/active fragment which is extracellular expressed on the cell surface. The binding as preferably perform vivo. APO4 polypeptides/ active fragments are also useful for section and antagonists by binding and observing the change activity. Effective pharmacological agents useful in diagnosis of treatment of disease are also identified using APO4 polypeptides fragments and APO4 signal transducer molecules that specifically with a cytoplasmic domain of APO4 and detecting a change in leve
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Example VII; Fig 13A; 156pp; English.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Wiley SR;
```

The sequence represents a DNA from the expression vector pDC409-L.
which encodes a fusion protein comprising a growth hormone leader
leucine Lipper multimerisation domain, and the extracellular doma
human TWEAK. The fusion protein was used in the isolation of human
receptor (TWEAKR)-expressing clones from a COS cell human cDNA li:
The TWEAK protein is a member of the tumour necrosis factor (TNF)
and induces angiogenesis. TWEAKR may therefore be used to screen
develop TWEAKR agonists and antagonists for the modulation of
angiogenesis, to be used in the treatment and diagnosis of human
complexity of an induces mediated by angiogenesis include ocular disorders
considered by ocular necvascularisation such as diabetic retin
neovascular glaucoma, retinoblastoma, retinopathy of prematurity,
corneal graft neovascularisation, and inflammatory diseases such
corneal graft neovascularisation, and inflammatory diseases such
malignant and metastatic conditions such as sarroomas and carcinom
mignant and metastatic conditions such as sarroomas and carcinom benign tumours and preneoplastic conditions, myocardial angiogene haemophilic joints, scleroderma, vascular adhesions, atherosclero plaque neovascularisation, telangiectasia, wound granulation, cor atherosclerosis, peripheral atherosclerosis and ischaemia

-!- SUBGELIGIAR LOCATION: Type II membrane protein and secreted.
-!- IISSUB SPECIFICITY: Highly expressed in adult heart, pancrea skeletal muscle, brain, colon, small intestine, lung, ovary, prostate, spleen, lymph node, appendix and peripheral blood lymphocytes. Low expression in kidney, testis, liver, placen thymus and bone marrow. Also detected in fetal kidney, liver
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  This SWISS-PROT entry is copyright. Lynch C.N., Wang Y.C., Lund J.K., Chen Y.-W., Leal J.A., Wiley S. TymbaK induces anajogenesis and proliferation of endothelial cell-10. Chem. 274:8459(1999).
-!- FUNCTION: Binds to FN14 and possibly also to TMRFSF12/APO3 induces of apoptosis in some cell types. Mediates NF-KappaB activation. May promote angiogenesis and the proliferation of endothelial cells.
                                                                                                                                                                                                                                                                                                                                                                                                                     "Identification of a ligand for the death-domain-containing recer

putative chicken CD40 ligand.";
R-2003) to the EMBL/GenBank/DDBJ databases.
Cytokine that binds to TNFRSF5. Mediates B-cell
cytokine that binds to TNFRSF5. Mediates B-cell
in the absence of co-stimulus as well as IgE
in in the presence of IL-4. Involved in immunoglobulin
tching (By similarity).

I. FUNCTION: Cytokine that binds to TNPRSFIIB/OPG and to
TNPRSFIIA/RANK. Obsteoclast differentiation and activation fa
Augments the ability of dendritic cells to stimulate naive T
proliferation. May be an important regulator of interactions
between T cells and dendritic cells and may play a role in t
regulation of the T cell-dependent immune response. May also
an important role in enhanced bone-resorption in humoral
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              by protecolytic processing. The cleavage may be catalyzed by ADAM17. A further shorter soluble form was observed.

DISEASE: Deficiency in TWFSF11 results in failure to form lo alveolar mammary structures during pregnancy, resulting in of newborns. Trance-deficient mice show severe osteopetrosis no osteoclasts, marrow spaces, or tooth eruption, and exhibit profound growth retardation at several skeletal sites, inclute limbs, skull, and vertebrae and have marked chondrodysplwith thick, irregular growth plates and a relative increase simple invpertrophic chondrocytes.

SIMILARITY: Belongs to the tumor necrosis factor family.
                                                                                                                                                                                                                                                                                                                                                                                                                                Lam J., Nelson C.A., Ross F.P., Teitelbaum S.L., Fremont D.H.; "Crystal structure of the TRANCE/RANKL cytokine reveals determin of receptor-ligand specificity."; J. --- DOMAIN: The SPOC domain, which mediates the interaction with NCOR2, is essential for the repressive activity.
---- SIMILARITY: Belongs to the Spen family.
---- SIMILARITY: Contains 1 RID (receptor interacting) domain.
---- SIMILARITY: Contains 4 RNA recognition motif (RRM) domains.
---- SIMILARITY: Contains 1 SPOC domain.
---- CAUTION: Ref. 2 sequences differ from that shown due to erron
FUNCTION: Essential corepressor protein, which probably regu-
different key pathways such as the Noch pathway. Negative
regulator of the Notch pathway via its inceraction with RBPSI
which prevents the association between NOTCH1 and RBPSUH, and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          This SWISS-PROT entry is copyright. Schackwitz W.S., Sherwood J.K., Wittak L.A., Nickerson D.A., Submitted (JAN-2003) to the EMEL/GenBank/DDBJ databases.

L. PUNCTION: VGrokime that binds to LIBR/TURRSP3. May play a specific in immune response regulation. Provides the membrane and for the attachment of the heterotrimeric complex to the cell surface. Isoform 2 is probably non-functional.

C. SUBUNIT: Heterotrimer of either two LTB and one LTA subunits (Less prevalent) one LTB and two LTB and one LTA subunits.

C. SUBGELLUIAR LOCATION: Type II membrane protein (Potential).

-!- FUNCTION: Cytokine that binds to TNFRSFS. Mediates B-cell proliferation in the absence of IL-4. Involved in immunoglobuliz class switching (By similarity).
-!- SUBGNUT: Homotrimer (By similarity).
-!- SUBGNUT: ACATION: Type II membrane protein. Also exists as extracellular soluble form (By similarity).
-!- PTM: The soluble form derives from the membrane form by
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  This SWISS-PROT entry is copyright. T. FUNCTION: Cytokine that binds to THRREFS/TORE. Binding to the

Gecy receptor ThrRsFeb modulates its effects. Activates NFKE

stimulates the proliferation of T cells, and inhibits growth
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Isold=043557-1; Sequence=Displayed;

-:- TISSUE SPECIFICITY: PREDOMINANTLY EXPRESED IN THE SPLEEN BUT
TISSUES SPECIFICITY: PREDOMINANTLY EXPRESED IN THE SPLEEN BUT
TISSUES AND IN HERRY, PLACENTA, LIVER, LUNG, APPENDIX, AND KI
AND NO EXPRESSION SEEN IN FETAL TISSUES, ENDOCRINE GLANDS, OF
NONHEMATOPOIETIC TUMOR LINES.

-:- INDUCTION: UPREGULATED AFTER T-CELL ACTIVATION.

-:- PTM: N-glycosylated.

-:- PTM: N-glycosylated.

-:- PTM: N-glycosylated.

-:- PTM: The soluble form of isoform I derives from the membrane
by proteolytic processing.

-:- SMILLARITY: Belongs to the tumor necrosis factor family.

-:- CAUTION: Ref. 4 sequence differs from that shown due to a
frameshift in position 178.

Isold-p13808-5; Sequence=VSP 000459, VSP 000461;
TISSUE SPECIFICITY: Isoform a is widely expressed at similar levels in all tissues examined. Isoforms B1 and B2 are predominantly expressed in stomach although they are also deteat lower levels in other tissues. Isoform C1 is stomach-specifisoform C2 is expressed at slightly higher levels in lung and stomach than in other tissues.
SIMILARITY: Belongs to the anion exchanger family.

cfects in TNFSFS are the cause of X-linked
ciency with hyper-igm type 1 (HIGM1) [MIN:308230]. HIGM1
moglobulin isotype switch defect characterized by
concentrations of serum igm and decreased amounts of all
ypes. Affected males present at an early age (usually
first year of life) recurrent bacterial and
ticl infections, including pneumocystis carinii pneumonia
tich infections, including pneumocystis carinii pneumonia
tich infection. Despite
on treatment with intravenous immunoglobulin, the
cgnosis is rather poor, with a death rate of about 10%
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 R LOCATION: Type II membrane protein. Also exists as an lar soluble form.
CIFICITY: Specifically expressed on activated CD4+

Chicheportiche Y, Browning JL; WPI; 1998-145619/13. N-PSDB; AAV18599. Tumour necrosis factor related ligand - useful for, e.g. treating auto-immune disease and immune responses to tissue grafts.

Claim 12; Page 48-50; 69pp; English.

The sequence is that of mouse tumour necrosis factor related liga. (TRELL). TRELL or active fragments can be included with a carrier pharmaceutical compositions to treat cancer, autoimmune diseases immune responses to tissue grafts, or to stimulate or suppress th system. It is useful to screen for TRELL receptors, by labelling

d treating immune responses using modulators, especially I TWEAK, TWEAK receptors and TWEAK ligands, useful for inflammation and graft versus host disease. . 얼

Fig 1; 45pp; English

```
The present sequence represents a TWEAK protein. The specificatic describes a method for preventing or treating an immunological di and/or inhibiting an immune response in an animal. The method com administering a TWEAK blocking agent. The method may be used for preventing and treating immune disorders associated with inapprof expression and/or activity of TWEAK. These disorders include autodiseases, acute and chronic inflammation, organ transplant reject Graft-versus-Host disease (GVHD). Iymphoid cell malignancies, segother forms of shock, loss of immune responsiveness (as seen in Fimmunodeficiency virus (HIV) infections) and failure of the immun
                                                                                                                                                                                                                                                                                                                                                                                            o

rosis Factor family receptor polypeptides and ligands - agnosis and treatment of prostate cancer and developmental

This invention describes isolated Tumor Necrosis Factor (TNF) fami receptor polypeptides: APO4, APO6, APO8 and APO9 or their active fragments, and isolated TNF related ligands 1 and 3 (TNRL1 and TNF their active fragments. APO4 is useful for diagnosing prostate can determining levels of APO4 in an individual. Prostate cancer can care treated using APO4 selective binding agents linked to a therapeut: moiety. APO4 polypeptides are also useful for identifying selective binding agents to the polypeptide/active fragment which is extracellular, agents to the polypeptide/active fragment which is extracellular, expressed on the cell surface. The binding is preferably performed vivo. APO4 polypeptides/active fragments are also useful for sort for agonists and antagonists by binding and observing the changer activity. Effective pharmacological agents useful in diagnosis or reatment of disease are also identified using a PO04 polypeptides/i fragments and APO4 signal transducer molecules that specifically with a cytoplasmic domain of APO4 and detecting a change in level activity. The method is performed in vivo or in vitro. APO polyper are all useful as immunogens for preparing antibodies. APO4 is all and a phormalities. APO4 was transfected to human breast carcinoma cell. Claim 40; Fig 13B; 156pp; English. gestational abnormalities. MCF-7, and induced apoptosis

.ion to inhibit neoplastic cell growth or for treating tumor rises polypeptides PRO179, PRO207, PRO320, PRO219, PRO221, PRO301, PRO526, PRO362, PRO366, PRO509 or PRO866.

4; 172pp; English.

iguence is that of human antitumour protein PRO207, as foetal kidney cDNA clone (see AAA9717). PRO207 shows quence identity to tumour necrosis factor family members, nan lymphotoxin-beta (23.4%) and human CD40 ligand (19.8%). 216. A claimed method for inhibiting the growth of a tumour sexposing the tumor cell to PRO139, PRO320, Lair agonists or chimeric polypeptides incorporating our is especially a cancer selected from breast, ovarian, tal, uterine, prostate, lung, bladder and central nervous melanoma and leukaemia. Methods for the recombinant the antitumour proteins are also provided

describes an equivalent or preventing or treating an immunological distandor inhibiting an immune response in an animal. The method compadministering a TWEAK blocking agent. The method may be used for preventing and treating immune disorders associated with inapproper expression and/or activity of TWEAK. These disorders include autodiseases, acute and chronic inflammation, organ transplant reject disease. Secular Loss of immune responsiveness (as seen in himmunodeficiency virus (HIV) infections) and failure of the immun
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Preventing and treating immune responses using modulators, especii antibodies, of TWEAK, TWEAK receptors and TWEAK ligands, useful for treating e.g. inflammation and graft versus host disease.
                                                                                                                                                                                                                                                                                                                                                  TWEAK protein; immunological disorder; immune response; inflammat:

59/40.

complex having a first polypeptide member of the r (TNF) ligand family, and a second different member, useful for treating cancer, osteoporosis or an factor family, imeric

ge 368-369; 388pp; English.

quence is the protein sequence for human TWEAK protein. The test to compositions comprising heterotrimeric complexes of sector (TNF) ligand family members, and their use in the vention and treatment of disease. In one embodiment, the complex comprises full-length or extracellular portions of length or extracellular portions of other TNF ligand, preferably VEGI or VEGI-SV. The heterotrimeric complexes on are useful for treating an autoimmune disease, cancer or and particularly for inhibiting cancer cell proliferation, or inducing apoptosis of T cells

New Endokine alpha gene useful for preparing a composition for tredisease associated with excessive or insufficient bone resorption osteoporosis, Paget's disease or arterial calcification.

Disclosure; SEQ ID NO 24; 145pp; English.

tumour necrosis factor family ligand. A composition comprising the isolated antibody or its fragment is used for treating an individuced of decreased level of endokine alpha activity. The endokine polypeptide present in a heterotrimeric complex is used for treatindividual having a disorder associated with excessive bone resort individual having a disorder associated with insufficient bone recomprises administering an endokine alpha antagonist, which is the antibody that binds specifically to endokine alpha polypeptide. It The invention relates to an isolated nucleic acid molecule encodi

eptides: ADO4, ADO6, ADO8 and ADO9 or their active isolated TNR related ligands 1 and 3 (TNRL1 and TNRL3) or ragments. ADO4 is useful for diagnosing prostate cancer by vels of ADO4 in an individual. Prostate cancer can also be APO4 selective binding agents linked to a therapeutic olypeptides are also useful for identifying selective. Useful in diagnosis/reatment of disease by binding of polypeptides/active fragment which is extracellular, or he cell surface. The binding is preferably performed in ypoptides/ active fragments are also useful for screening an antagonists by binding and observing the changer in APO4 cive pharmacological agents useful in diagnosis or isease are also identified using APO4 polypeptides/active APO4 signal transducer molecules that specifically interact smic domain of APO4 and detecting a change in level of APO4 method is performed in vivo or in vitro. APO polypeptides as immunogens for preparing antibodies. APO4 is also gnosis/treatment of developmental or gestational describes isolated Tumor Necrosis Factor (TNF) family uced apoptosis

```
The sequence represents a fusion protein encoded by the expression vector pDC409-LZ-TWEAK. The fusion protein comprises a growth horm leader, a leucine zipper multimerisation domain, and the extracell domain of human TWEAK. The fusion protein was used in the isolatic human TWEAK receptor (TWEAKR)-expressing clones from a COS cell human TWEAK receptor (TWEAKR)-expressing clones from a COS cell human TWEAK receptor (TWEAKR) expressing clones from a COS cell human TWEAK receptor (TWEAKR) gonists a member of the tumour necrosis (TWF) family and induces angiogenesis. TWEAKR may therefore be use screen for and develop TWEAKR agonists and antegonists for the moc of angiogenesis, to be used in the treatment and diagnosis of human disorderised by ocular neovascularisation such as diabetic retinct neovascular glaucoma, retinoblastoma, retinopathy of prematurity, retrolental fibroplasia, rubeosis, uveitis, macular degeneration a rethritis, rheumatism and psoriasis.
